Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Van Der Bruggen

Novel MAGE-A1 human leukocyte antigen class II peptides which bind to and are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.

Claim 3; Page 42; 78pp; English.

antigen) class II-binding protein. Peptides derived from the MAGE-A1 HLA binding protein stimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-A1 HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1. The protein is used for treating a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA binding protein are useful in the production The present sequence is derived from a human MAGE-A1 HLA (human leukocyte of anti-tumour vaccines

Sequence 16 AA;

```
The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked to together in a different relationship relative to their linkede in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, overvix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, cesophagus, brain, testicle, uterus), as potentitating against a comprising the polypeptide may be used in the treatment or prophylaxis against virus, hepatitis, influenza, Japanese encephalitis immunodeficiency virus), hepatitis, influenza, Japanese encephalicis (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, salmonella, Streptococcal, Legionella and Mycobacterium or parasitic

These peptides are useful for defining epitopes that engender a HLA-restricted cytotoxic lymphocyte activity against MAGE-1 antigens. Compsns. containing these peptides can be administered, as a vaccine to patients susceptable to MAGE associated tumours, e.g. melanomass. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents a human MAGE-A1 HLA (human leukocyte antigen) class II-binding protein. Peptides derived from the MAGE-A1 HLA binding protein atimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-A1 HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1. The protein is used for treating a disorder characterized by expression of MAGE-A1 coch as cancers e.g. melanomal, squamous cell carcinomas, of endanced actinomas, osteosarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA binding protein are useful in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Functional variants and isolated mimetics of a MAGE-A1 HLA-B35 or HLA-B44 binding peptide, used in diagnosis and treatment of a disorder characterized by expression of MAGE-A1 or -A3.
                                                                                                                       Novel MAGE-A1 human leukocyte antigen class II peptides which bind to are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MAGE antigenic peptide; Human leukocyte antigen; HLA-B35; HLA-B44; tumour cell; immunostimulant; antigen presentation; cancer; melanoma; CD8+ cytotoxir T lymphocyte; colorectal; prostate; gastric carcinoma; myeloma; brain tumour; sarcoma; seminoma; ovarian tumour; cytostatic; gene therapy; human; MAGE-A1; tumour rejection antigen; TRA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   precursor (TRAP) MAGE-A1. MAGE-A1 cDNA (see ANG9719) shows homology to novel human MAGE-C1 cDNA (see ANG8720). MAGE-C1 (see AAW81546) is a novel member of the MAGE family that may be recognised by cytotoxic T cells, leading to lysis of the tumour cells which express it. It is expressed in a variety of tumours and in normal testis cells, but not by other normal cells. The invention provides MACE-C1 and MAGE-C2 nucleic acids and polypeptides, useful e.g. in a claimed method for determining the presence of cytolytic T cells specific for complexes of a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                              rejection antigen precursors - used for determining presence of ic T cells specific for complexes of a human leukocyte antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                         The invention relates to functional variants and isolated mimetics of a MAGE-A1 human leukocyte antigen (HLA)-B35 or HLA-B44 binding peptide, or of a MAGE-A1 human leukocyte antigen (HLA)-B35 or HLA-B44 binding peptide, or the specification. MAGE genes encode tumour rejection antigens (TRAA) presented to T lymphocytes by HLA-B35 and HLA-B44 molecules. The MAGE antigenic peptide acts by binding to HLA molecules on tumour cells and stimulating recognition of these cells and thus signalling them to the immune system for destruction. The peptide when presented by HLA molecule induces the activation and stimulation of CD8+ cytotoxic T lymphocytes. The MAGE antigenic peptide is used to treat and diagnose disorders characterised by expression of MAGE-A1 or -A3. Disorders include cancers commense, oesophageal, lung, head and neck, breast, colorectal, prostate, renal, bladder, hepatocellular, papillary thyroid and gastric carcinomas, myelomas, brain tumours, sarcomas, seminomas, and ovarian tumours. The present sequence is human MAGE-A1 protein
                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an

immune response against a pathogen or cancer. Also included are a synthetic polypeptides encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, cosophagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against virus), hepatitis, influenza, Japanese encephalitis virus, bestein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Giaddia) infections. The present sequence is a consensus sequence for a parent protein used to design a savine of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; epitope; vaccine; immunotherapeutic; cytostatic; immunogenicity;

Also described is a vaccine or immunotherapeutic composition (VC) comprising (1). (1) has cytostatic activity. VC is useful for treating an animal, by administering to an animal, by administering to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel epitopes useful as vaccines, comprises peptides or nucleic acid encoding the peptides, that are useful epitopes of target-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid molecule which encodes a tumour rejection antigen precursor (TRAP) having an amino acid sequence of a TRAP encoded by a fully defined MAGE-53, WAGE-B5, or MAGE-B6 polynucleotide sequence. Also disclosed is a method which is useful for determining presence of cytolytic T-cells specific for complexes of human leukocyte antigen (HLAA) and a peptide detrived from the nucleic acid in a cytotocxic T-lymphocyte (CTL)-containing sample. The nucleic acid is useful as a diagnostic probe to determine the presence of abnormal
immunogenicity of a vaccine or immunotherapeutic composition, by administering VC to an HIA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal. or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (I) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptide complex, and further comprises BLISPOT analysis, polymerase chain reaction (FRC. Ago83843 to ABQ83858 and ABP74128 to ABD74113 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TRAP; tumour rejection antigen precursor; cytolytic T-cell; CTL; tumour; seminoma; bladder transitional-cell carcinoma; NSCLC; adaptor; head-and-neck squamous-cell carcinoma; breast carcinoma; sarcoma; cutaneous melanoma; nonsmall cell lung cancer; MAGE-A1; human.

             head-and-neck squamous-cell carcinoma, breast carcinoma, sarcoma, cutaneous melanoma or nonsmall cell lung cancer (NSCLC) which express MAGE-C1. MAGE-B5 or MAGE-B6. The nucleic acid is useful for diagnoshing a disorder characterised by expression of MAGE-C1, MAGE-B5 or MAGE-B6 TRAPs or tumour rejection antigens (TRAS). The present sequence represents the amino acid sequence of the human tumour rejection antigen MAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated epitope polypeptide that has high affinity for major histocompatibility complex (MHC) class I, and an epitope cluster comprising the polypeptide. Also disclosed is a vaccine or immunotherapeutic composition containing an epitope of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, chemotherapy biochemotherapy or surgery. The composition is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic compound. Multimeric Peptide complexes of the invention are useful for determining specific T response, by performing the method is useful for evaluating immunological response, by performing the method prior to and subsequent to an immunisation step. Compositions of the invention are useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a pharmaceutical composition containing at least one modified RNA encoding a biologically active or antigenic protein. The RNA is modified to optimise translation of the sequence. The compositions are used for vaccination against a wide range of infectious diseases (viral, bacterial or protozoal) or cancer, or for tissue regeneration, e.g. in cases of Alzheimer's or Parkinson's diseases and arthritis, but also to express proteins such as dystrophins, chloride ion channels (for treating cystic fibrosis) and enzymes (either for treating metabolic disorders or for synthesis of neurotransmitters such as dopamine). The present sequence is the wild-type MAGEI protein
                                                                                                                                                                                                                                                                                                                                                                           Stabilised mRNA, translation optimised; vaccine, tissue repair; sequence modification determination; gene therapy; cytostatic; virucide; antibacterial; protozoacide; nootropic; neuroprotective; infection; antiparkinsonian; immunostimulant; cancer; MAGE1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymelectides are particularly useful for treating or preventing
                                                                                                                                                                                                                                                                                                                                                                                                   myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at

The present sequence represents a novel fusion protein composed of lipidated protein D (LPD) of Haemophilus influenzae B, the human MAGE-1 tumour-associated antigen and amexahistidine tail. The invention relates to MAGE proteins fused to an immunological fusion partner such as LPD. The LPD moiety provides the fusion protein with additional exogenous T-cell epitopes and also increase expression levels in E. coli. The lipid tail ensures optimal presentation of the antigen to antigen-presenting cells. The affinity tag facilitates purification. The novel fusion proteins provide vaccines for immunotherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and non-small cell lung cancer, head and squamous cell carcinoma, colon carcinoma and oesophagus
                                                                                                                                                                                                                                                                                                                                                                                                                        New protein derivatives used in cancer vaccine therapy for treating a range of cancers including melanomas, carcinomas and cancers of breast.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a fusion protein composed of the C-terminal portion of the Streptococcus pneumoniae LYTA protein (CIVTA), the human MAGE-1 tumour-associated antigen and a hexahistidine tail. A vector designed for recombinant expression of the fusion protein in Scherichia coli is provided. The CIVTA moiety provides expression of soluble fusion protein, facilitates affinity purification, and also acts as a T-helper epitope. The invention relates to MAGE proteins fused to an immunological fusion partner, e.g. CLVTA-MAGE-1-His. These novel fusion proteins provide vacchnes for immunocherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and non-small cell lung cancer, head and squamous cell carcinoma, colon carcinoma and oesophagus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MAGE-1; lipoprotein D; LPD-MAGE-1-His; fusion protein; tumour; melanoma;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                          October 7, 2004, 15:30:52; Search time 59.6364 Seconds (without alignments) 86.336 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 18,

Sequence 10, Application US/08993118

Patent No. 5997872

GENERAL INFORMATION:
APPLICANT: LUCAS, Sophie;
APPLICANT: BOON-FALLEUR, Thierry
TITLE OF INVENTION: ISOLATED NUCLEIC ACID MOLECULE CODING FOR TUMOR
TITLE OF INVENTION: REJECTION ANTIGEN PRECURSOR MAGE-C1 AND USES
TITLE OF INVENTION: THEREOF
NUMBER OF SEQUENCES: 14
CORRESPONDENCE ADDRESS:

That agene product is a cytoplasmic protein.";

Int. J. Cancer 59:435-439(1994).

-!- FUNCTION: Not known, though may play a role in embryonal development and tumor transformation or aspects of tumor progression. Antigen recognized on a melanoma by autologous cytolytic T lymphocytes.

C. -!- SUBCELLULAR LOCATION: Cytoplasmic.

C. -!- SUBCELLULAR LOCATION: Antigen several types, carcinoma and breast carcinoma, but not in normal tissues except for testes. Never expressed in kidney tumors, leukemias and

-!- CATALYTIC ACTIVITY: 5-methyltetrahydropteroyltri-L-glutamate + L-homocysteine = tetrahydropteroyltri-L-glutamate + L-homocysteine = tetrahydropteroyltri-L-glutamate + L-methionine.
-!- COFACTOR: Zinc; binds one ion per subunit (By similarity).
-!- PATHWAX: Terminal step in the de novo biosynthesis of methionine.
-!- SIMILARITY: Belongs to the vitamin-B12 independent methionine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-MAY-2000 (Rel. 39, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -1. CATALYTIC ACTIVITY: Release of an N-terminal amino acid, Xaa- | - Xbb-, in which Xaa is preferably Leu, but may be other amino acids including Pro although not Arg or Lys, and Xbb may be Pro. - COFACTOR: Binds 2 manganese ions per subunit (By similarity). - SUBCELLULAR LOCATION: Cycoplasmic (By similarity). - SIMILARITY: Belongs to peptidase family M17.
   Probable cytosol aminopeptidase (EC 3.4.11.1) (Leucine aminopeptidase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                R MENOPS; MI.UPW; -.

I Mature 409:1007-1011(2001).
I Nature 409:1007-1011(2001).
I Dept. PPM: This protein undergoes a protein self splicing that involves a post-translational excision of the intervening region (intein) followed by peptide ligation (Potential).

- I SIMILARITY: Belongs to the UPPF0051 (ycf24) family.
                                                                                                                                                                                                                                                           Gaps

Mol. Gen. Genet. 244:90-96(1994).

I altered fatty acid synthase gene.";

Mol. Gen. Genet. 244:90-96(1994).

-!- FUNCTION: Fatty acids from acetyl-CoA, malonyl-CoA and NADPH.

C long-chain fatty acids from acetyl-CoA, malonyl-CoA and NADPH.

The alpha subunit contains domains for: acyl carrier protein.

3-oxoacyl-lacyl-carrier protein] reductase, and 3-oxoacyl-(acyl-carrier-protein] synthase. This subunit coordinates the binding of the six beta subunits to the enzyme complex.

-!- CATALYTIC ACTIVITY: Acetyl-CoA + N CO(2) + 2N NADPH = a long-chain acyl-CoA + N CO(2) + 2N NADPH = a carrier protein] = 3-oxoacyl-[acyl-carrier protein] + malonyl-(acyl-carrier protein] + malonyl-(acyl-carrier protein] + 3-oxoacyl-[acyl-carrier protein] + CO(2) + CATALYTIC ACTIVITY: Acyl-carrier protein] + CO(2) + CATALYTIC ACTIVITY: Acyl-carrier protein] + CO(2) + CATALYTIC ACTIVITY: (3)-3-dydroxyacyl-[acyl-carrier protein] + CO(2) + CATALYTIC ACTIVITY: (3)-3-dydroxyacyl-[acyl-carrier protein] + NADPH.

-!- CATALYTIC ACTIVITY: (3)-3-dydroxyacyl-[acyl-carrier protein] + NADPH.

-!- CATALYTIC ACTIVITY: (3)-3-dydroxyacyl-[acyl-carrier protein] + CO(2) + CATALYTIC ACTIVITY: (3)-3-dydroxyacyl-[acyl-carrier protein] + NADPH.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Novel MAGE-A1 human leukocyte antigen class II peptides which bind to and are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1. Van Der Bruggen P; MAGE-A1; HLA; human leukocyte antigen; CD4+ T lymphocyte; cancer; MAGE-A1 HLA class II-binding protein; vaccine. Peptide derived from human MAGE-Al HLA class II-binding protein. Boon-Falleur T, Æ Chaux P, Claim 3; Page 42; 78pp; English. AAB31292 standard; peptide; 16 (LUDW-) LUDWIG INST CANCER RES. 14-JUN-2000; 2000WO-US016287. 99US-00336091. (first entry) Van Snick J, Lethe B, WPI; 2001-102698/11. WO200078806-A1. Homo sapiens. 18-JUN-1999; 20-APR-2001 28-DEC-2000. AAB31292; RESULT 1 AAB31292 

The present sequence is derived from a human MAGE-A1 HLA (human leukocyte antigen) class II-binding protein. Peptides derived from the MAGE-A1 HLA binding protein stimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-A1 HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1. The protein is used for treating a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, osteosarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA binding protein are useful in the production of anti-tumour vaccines

The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linked of parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptides. The synthetic polypeptides and polymotleotide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polymotleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breat, ovary, cervix, colon, head on neck, pancreas, prostate, stomach, bladder, kidney, bone liver, and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human immunity, Epstein-Barr virus, betaind respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Slamonella, Streptococcal, Legionella and Mycobacterium or parasitic (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Trypanosoma, Toxoplasma and Glazdia) infections. The present sequence is a peptide derived from a parent protein used to construct a savine of the

These peptides are useful for defining epitopes that engender a HLA-restricted cytotoxic lymphocyte activity against MAGE-1 antigens. Compans. containing these peptides can be administered, as a vaccine to patients susceptable to MAGE associated tumours, e.g. melanomas. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This is the amino acid sequence of human tumour rejection antigen precursor (TRAP) MAGE-A1 CDNA (see AAV69719) shows homology to movel human MAGE-C1 cDNA (see AAV69720). MAGE-C1 (see AAW81546) is a novel member of the MAGE family that may be recognised by cytotoxic T cells, leading to lysis of the tumour cells which express it. It is expressed in a variety of tumours and in normal testis cells, but not by other normal cells. The invention provides MACE-C1 and MACE-C2 nucleic acids and polypeptides, useful e.g. in a claimed method for determining the presence of cytolytic T cells specific for complexes of a human
                                                                                                                                                                                                                                                                                                                       rejection antigen precursors - used for determining presence of tic T cells specific for complexes of a human leukocyte antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                           Novel MAGE-A1 human leukocyte antigen class II peptides which bind to and are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.
                                                                                                                                                                                                     antigen) class II-binding protein. Paptides derived from the MAGE-AI HLA binding protein stimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-AI HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-AI. The protein is used for treating a disorder characterized by expression of MAGE-AI such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, osteoastcomas, and lymphocytic leukemias. Peptides derived from the MAGE-AI HLA binding protein are useful in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Functional variants and isolated mimetics of a MAGE-A1 HLA-B35 or HLA-B44 binding peptide, used in diagnosis and treatment of a disorder characterized by expression of MAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MAGE antigenic peptide; Human leukocyte antigen; HLA-B35; HLA-B44; tumour cell; immunostimulant; antigen presentation; cancer; melanoma; CD8+ cytotoxic T lymphocyte; colorectal; prostate; gastric carcinoma; myeloma; brain tumour; sarcoma; seminoma; ovarian tumour; cytostatic; gene therapy; human; MAGE-A1; tumour rejection antigen; TRA.
